

To Transform and Secure Business through Innovation

Pure Action Oriented

Dynamic Risk Mitigation.

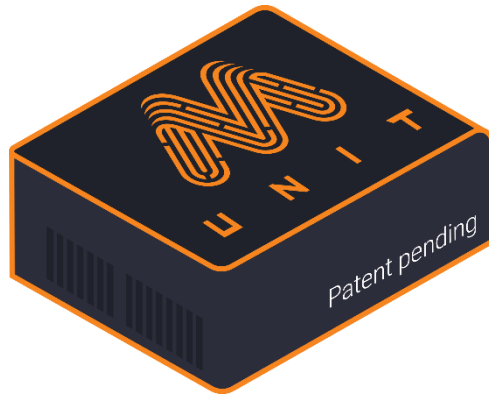

Controlled risk and increased accountability

Easy implementation

Secure your organization

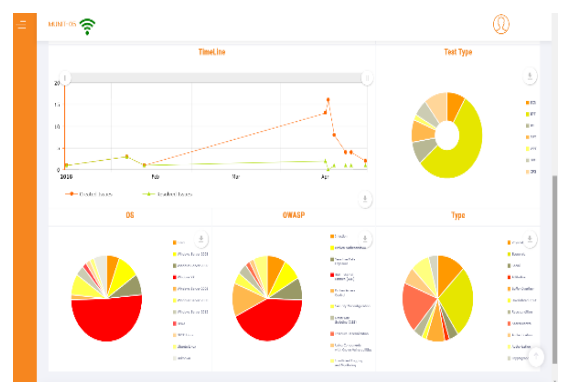

- Cybersecurity snapshots
- Vulnerability assessment
- Vulnerability and action tracking
- Patch management
- Business impact and risk matrix

UNIT is an innovative solution developed by Cyberteq for cybersecurity assurance. Through its revolutionary concept, mUnit re-shapes the way of handling cybersecurity by replacing traditional assessment reports with an active mitigation plan. It allows the management to have visibility on vulnerabilities level and related risk/business impact.

mUnit adopts holistic approach of Cybersecurity assurance based on assessment, boost and compliance. Networks/systems are being assessed regularly using automatic scanning and manual vulnerability scripts prepared by Cyberteq team. Continuous tracking of mitigations helps to boost security level and compliance is achieved against international security standards.

Continuous security assurance

Protect brand reputation

How it Works

mUnit continuously checks the network, identifies internal/external vulnerabilities and measures their business impact. mUnit Assurance team connects to the network through a very secured and encrypted remote connection (SSH Connection).

Upon detecting a vulnerability, a ticket is opened with all details (description, type, impact, OS, IP and related mitigation). Tickets will be assigned to a related system owner and notification will be sent. If needed escalation will be done to Cyber-teq assurance team to support clearing it..

Through mUnit ticketing system, vulnerabilities are logged, tracked and escalated. The system owner will access all technical vulnerability details from the ticketing system together with related mitigations.

All activities can be tracked through mUnit's Dashboard. It gives the management visibility on cybersecurity level. It also shows all risks and business impacts. In addition, mUnit Dashboard provides information about different types of performed assessments, vulnerability types and much more.

Security in Focus

- No open ports: mUnit cannot be accessed directly from the organization's networks.
- Remote Access: mUnit can be accessed remotely through a secured jump server.
- Strict firewall rules: prevents unauthorized access to and from the mUnit.
- Encrypted Communications: all access and communication are securely encrypted by SSH.
